

# GM805 Series Barcode Reader Module User Manual

**GM805-S**

**GM805-L**

Hangzhou Grow Technology Co., Ltd.  
V1.2.4 May. 2025

# Revised Version

<b>Version Number</b>	<b>Date</b>	<b>Revise Content</b>	<b>Modifier</b>
V1.1	2023.05	1. Add function: Through the serial port, send the serial command to enable or disable the setting code function.  (More details: 1.6 Setup Code)	Grow Tech
V1.2	2023.09	1. Added AIM serial instruction(Appendix B) 2. Added Micro PDF417,Micro QR, Aztec	Grow Tech
V1.2.1	2024.03	1. Added case setting code.(More details in 2.2.2)  2. Added Output Data code format RAW OUTPUT. (More details in 6.5)  3. Added prefix and suffix serial command. (More details in 10.6)	Grow Tech
V1.2.2	2024.07	1. Upgrade GM805-S lens	Grow Tech
V1.2.3	2025.05	1. Add 200ms/300ms/400ms setting code in command trigger mode.  (3.4 Command Triggered Mode )  2. Modify the suffix zone bit and add suffix examples.(10.6 List of zone bit, Appendix B)	Grow Tech
V1.2.4	2025.05	Modify the setting code for "Change tail to "TAB". (7.6)	Grow Tech

## 1. Introduction of Module

### 1.1 Introduction

GM805 series have GM805-S and GM805-L model. The only difference between GM805-S and GM805-L is the lens. GM805-S lens reading distance is 5-30cm. GM805-L lens reading distance is 7-50cm.(The actual data depends on the size and content of the code)

GM805 series bar code reader module is a high performance scanner, can read 1D bar code easily and read 2D bar code with high speed. It also wins high scan speed for linear code, even for bar code on paper or screen.

GM805 series bar code reader module is an advanced bar code decoding algorithm which developed on image recognition algorithm, can easily and accurately read bar code, simplify secondary development.

#### 1.1.1 Read Version Information

Read Version Information

### 1.1.2 Read the Unique Device ID

Read the Unique Device ID

## 1.2 Technical Specification

Parameter	Performance
Sensor	CMOS
Scan Mode	640*480
Lighting	White LED
Indicator Light	Blue LED
Read Code Type	1D: EAN-13, EAN-8, UPC-A, UPC-E ISSN, ISBN, CodaBar, Code 128, Code93, ITF-14, ITF-6, Interleaved 2 of 5, Industrial 2 of 5, Matrix 2 of 5, Code 39, Code 11, MSI-Plessey, GS1 Composite, GS1-Databar (RSS) 2D: QR Code, Data Matrix, PDF417, Micro QR, Micro PDF417, Aztec
GM805-S	
Reading Distance	5-30cm
GM805-L	
Reading Distance	7-50cm
Contrast*	>25%
Scan Angle**	Roll: 360° Pitch: 65° Yaw: 65°
Viewing Angle	67° (Horizontal) 53° (Vertical)
Accuracy of reading*	≥10mil

\* Test conditions: environment temperature =23°C; environment illumination =300 LUX;

\*\* Test conditions: Test distance = (minimum depth of field + maximum depth of field) /2; environment temperature =23°C; environment illumination =300 LUX;

### Mechanical/electrical Parameters:

Parameter	Performance
Interface	TTL-232/USB
Size(mm)	28*20 mm
Weight	2.1 g
Prompting mode	Buzzer LED Indicator
Operating Voltage	5V
Operation Current	70mA(Max)
Standby Current	≤6mA(Typical)
Startup time	≤250mS (Typical)

### Environmental Parameters:

Parameter	Performance
Operating temperature	-20°C~+60°C
Storage Temperature	-40°C~+70°C
Operating Humidity	5%~95% (Non-Condensing)
Environmental Light	Normal indoor light source
Fall	Withstand 1.2 m drop on concrete floor (50 times 1.2 m drop on concrete floor repeatedly)

### Default read configuration:

## 1.3 Electrical Characteristics

### 1.3.1 Power Supply Requirements

The power supply is DC +5V. The power input is allowed only after the GM805 series is properly connected.

Electrical components of the GM805 series may be damaged if you insert or remove the cable (with the electric plug) when the cable is live. Ensure that the power supply is switched off when you insert or remove the cable.

The GM805 series may not work properly due to poor power connections, short power off/on intervals, or excessive voltage drop pulses. So pls keep the power is stable. After the power is turned off, the power must be turned on at least two seconds later.

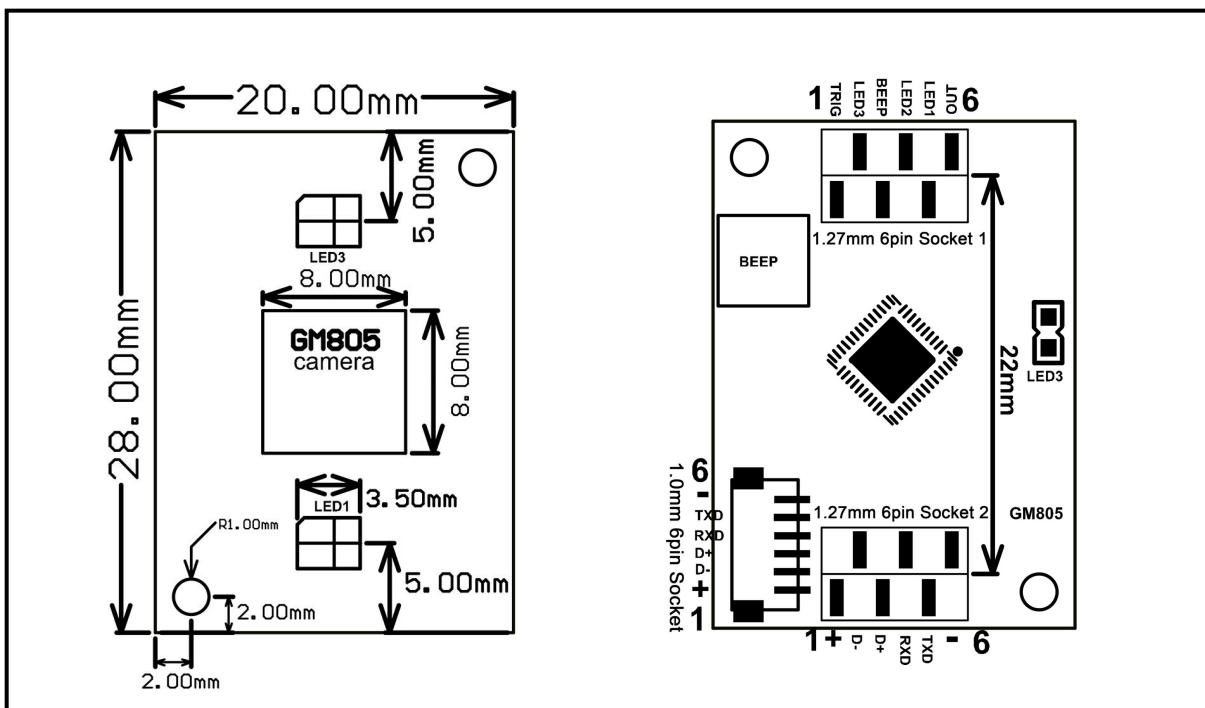

### 1.3.2 Ripple noise

Since the power input of GM805 series is directly supplied to the image sensor and decoding chip.

To ensure stable operation, pls use low ripple noise power input.

It is recommended that the ripple noise not exceed 50mV (peak-to-peak).

## 1.4 Dimension(mm)&Pin Definition

### 1.27mm 6pin Socket 1 Definition:

No.	Definition	Instruction
1	TRIG	Key trigger pin, low level trigger
2	LED 3	Decoding success light, high level effective
3	BEEP	sfn output
4	LED 2	Collimation light, high level effective
5	LED 1	Lighting, high level effective
6	OUT	Output control pin, default low level, can be controlled by serial

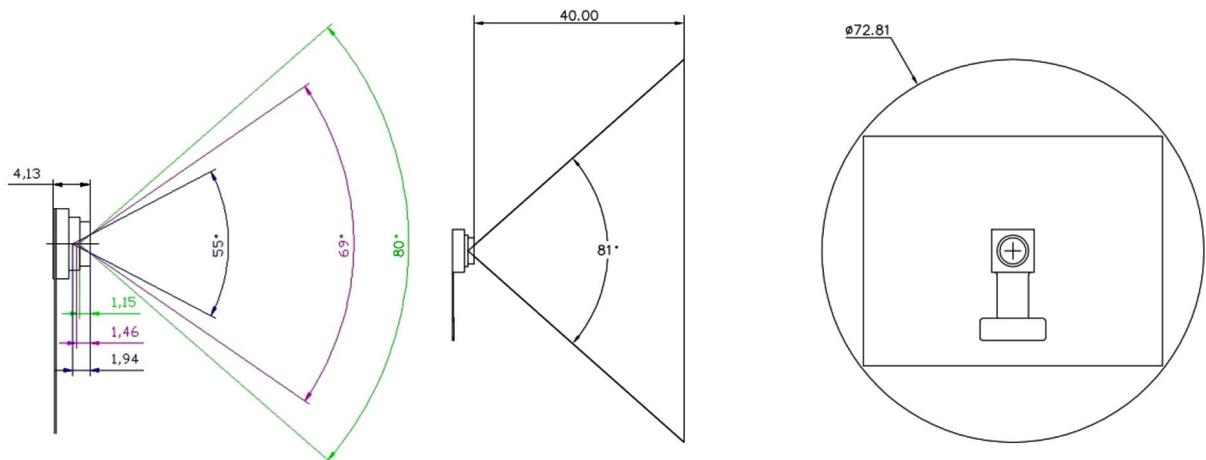

### UART /USB Interface Definition (1.0mm 6pin Socket 1)    1.27mm 6pin Socket 2)

No.	Definition	Instruction
1	VCC	Power input 5V
2	D-	USB data input
3	D+	USB data output
4	RXD	Serial port receiver signal (TTL Level)
5	TXD	Serial port send signal (TTL Level)
6	GND	Signal ground

**Interface Instruction:**

- a) The default baud rate of UART is 9600bps. Data format: 8 data bits, 1 stop bit, and no parity bit.
- b) If the upper computer is MCU (3.3V), it is connected to TX and RX directly; If the upper computer is PC, it needs to be connected to RS232 level conversion chip.

## 1.5 Scan Area

Reference design for lens opening:

The diagonal field Angle of the camera is  $80^\circ$ , so a certain allowance should be reserved during design.

As shown in Figure  $81^\circ$ , the light path cannot be blocked within this conical range;

Based on 5.2-inch mobile Phone Alipay QR code zero onset, bowl depth 40mm;

Pmma-4h or ultra white glass is recommended for window materials.

## 1.6 Setup Code

Customer can set module by scan setup code.

**Default: setup code on**

**Off**

Output details in setup code

**Default: Not output**

**Output**

Through the serial port, send the serial command to enable or disable the setting code function.

**If need enable setting code function:**

1. Send serial command: **\_SET\_CODE\_ON**
2. Then send save serial command to save: **7E 00 09 01 00 00 00 AB CD**

**If need disable setting code function:**

1. Send serial command: **\_SET\_CODE\_OFF**
2. Then send save serial command to save: **7E 00 09 01 00 00 00 AB CD**

## 1.7 Save and Cancel

Scan cancel code to cancel wrong read date.

**Save**

**Cancel last byte**

**Cancel all read bytes**

**Cancel changes**

## 1.8 Reset

Back to Factory Setting by scan follow code.

Reset

## 1.9 User Default Settings

In addition to factory settings, users also can save their frequently used configurations as default Settings. By scanning Save "Current Settings as User Default Settings", users can save the current device configurations as default settings. If the module already has default user settings, the new configuration replaces the original default user settings.

By scanning "Restore the user default settings", the module can be switched to user default settings.

Save Current Settings as User Default Settings

Restore the User Default Settings

## 2 Communication interface

GM805 series can receive database, control module and set functional parameter by TTL - 232.

### 2.1 Serial Communication Interface

It's default and common to connect module and mainframe(such as PC, POS) by serial communication interface. Make sure communication parameter for module and mainframe are same, then it will communicate smooth and correctly.

TTL-232 is used for serial interface which suitable for most system. Required change-over circuit for RS-232.

Default Parameter as formForm 2- 1. Only Baud Rate can be changed.

Form 2-1 Default Parameters

Parameters	Default
Serial communication interface	Standard TTL-232
Baud rate	9600
Verification	N
Data bit	8
Stop bit	1
CTSRST	N

#### Baud Rate Settlement

38400bps

57600bps

115200bps

### 2.1.1 Serial Port Check Bit Configuration

Modify the parity bit of the serial port by scanning the following configuration code.

\*NONE

ODD

EVEN

### 2.1.2 Serial Port Calibration

Customers can periodically send heartbeat packets to ensure the data accuracy. The format is as follows:

Heartbeat packets from main control	Return command
7E 00 0A 01 00 00 00 30 1A	03 00 00 01 00 33 31

Note: It is recommended to send a heartbeat packet every 10 seconds. If no correct reply is received for three consecutive times, the main control should handle it accordingly.

## 2.2 USB HID Interface

Scan the following code to become HID device when module connects PC by USB.

### 2.2.1 HID Type Device Selection

When the device is a HID type device, it can be 2 different types of devices.

### 2.2.2 HID Parameter Configuration

Scan the following code to modify the PC access cycle for HID devices.

Modify the interval between the device from a valid message to a released message by scanning the following setup code.

\*0ms

1ms

5ms

10ms

15ms

Modify the interval between the device from releasing message to the next valid message by scanning the following setup code.

\*0ms

1ms

5ms

10ms

15ms

Modify the state of the CapsLock when it prints by scanning the following setup code.

\*Off

On

Compatible Mode

(7E 00 08 01 00 20 02 AB CD)

Case takes inverse output

Case normal output

All Upper Case

All Lower Case

### 2.2.3 HID Lead Key Output

By scanning the following setup code to make HID output a leading message before each segment of data, so as to facilitate customer software development and positioning. The key value is ctrl+shift+r.

\*HID leading Forbid

Allow

## 2.3 USB HID-KBW

### 2.3.1 HID-KBW Device Mode

If the device is an HID device (if it is not an HID device, pls read the configuration code of the HID device first),you can read the following configuration code and select HID-KBW device mode.

\*HID-KBW

### 2.3.2 HID-KBW Serial Output at the Same Time

By scanning the following setup code,while HID KBW is output, data is output through serial port.

\*Forbid

Allow

## 2.4 USB HID-POS

### 2.4.1 HID-POS Device Mode

If the device is an HID device (if it is not an HID device, pls read the configuration code of the HID device first),you can read the following configuration code and select HID-KBW device mode.

HID-POS

#### 2.4.2 HID-POS HID-KBW Output at the Same Time

By scanning the following setup code to enable HIDKBW data output while HIDPOS output.

\*Forbid

Allow

#### 2.5 USB Virtual Serial Port

Scan the following code to become virtual serial port output pattern when module connects PC by USB.

USB Virtual serial port

## 3 Read Mode

### 3.1 Continuous Mode

On this mode, reading module read code continuous and automatic.

Break after reading one code, break time is changeable.

Click the toggle key to pause. Then click to continuous cyclic read code.

**Default Continuous Mode**

#### Time settlement for single read

The longest time before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

1000ms

\*5000ms

3000ms

infinite time interval

#### Break time settlement

Time between two read. Can be settled from 0 to 25.5 s, step-size: 0.1s; default 1.0s

No break

500ms

default 1000ms

1500ms

2000ms

#### Same barcode reading delay

The same barcode reading delay refers to that after the module reads the same bar code, it will be compared with the last reading time, when the interval is longer than the reading delay, the same barcode is allowed to be read, otherwise the output is not allowed.

Same barcode reading delay

\*Same bar code reading without delay

#### Same barcode reading delay time

When the same barcode reading delay is enabled, scan the following code to set same barcode reading delay time.

Infinite delay

500ms

\*1000ms

3000ms

5000m

## 3.2 Induction Mode

After setting, module begins to monitor brightness immediately. When scene changed, module will begin to read until time of image stabilization over.

After first successful reading or single reading time out, module will monitor brightness again after some time (changeable)

Module will cycle working as above when follow happen: module can't find code between single read time, then it will stop reading and jump to monitor brightness.

On induction mode, module can begin reading code by click, and it will begin to monitor brightness when release toggle key or successfully output information.

**Induction Mode**

#### **Time settlement for single read**

The longest time read before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

1000ms

3000ms

Default 5000ms

infinite time interval

#### **Break time settlement**

After one successful output or time out for single read. Module will be into monitor after some time.

Time from 0 to 25.5 s, step-size: 0.1s; default 1.0s

No Break

500ms

Default 1000ms

1500ms

2000ms

### Image stabilization time

Image stabilization time: the time cost after module find scene change then waiting for the scene stable. Time from 0s to 25.5s, step size 0.1s. Default 0s.

\*0ms

100ms

400ms

1000ms

2000ms

### Sensitivity

Detect the degree of change in the scene in inductive reading mode. When the reading module judges that the scene change degree meets the requirements, it will switch from the monitoring state to the reading state.

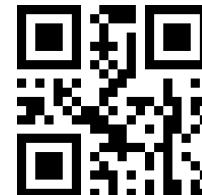

\*Ordinary sensitivity

Low sensitivity

High sensitivity

Extra high sensitivity

### Same barcode reading delay/Same barcode reading delay time

The setup code is the same as in **Continuous Mode**.

## 3.3 Manual Mode

Manual mode is default mode. Click toggle key begin to read, stop when output or release toggle key

Manual Mode

### 3.3.1 Trigger Mode

Scan the following code to configuration edge trigger or level trigger.

\*Level Trigger

Edge Trigger

### 3.3.2 Sleep Mode Choice

In this mode, the module automatically enters sleep mode after being idle for a certain period of time by default. After entering sleep mode, you can press the key to wake up.

You can set the sleep mode using the following code (the deep sleep function cannot be enabled in USB communication mode).

Allow Sleep Mode

\*Forbid Sleep Mode

### 3.3.3 Idle Time For Sleep Mode

Scan the following configuration codes to set the idle time for sleep mode.

0ms

\*500ms

3000ms

5000ms

6000ms

7000ms

### 3.4 Command Triggered Mode

Module begins to read when receive scan command from mainframe( bit0 of zone bit 0x0002 writes "1") , and stop at output or read timeout.

**Command triggered mode**

Under command triggered mode, command for serial port trigger is 7E 00 08 01 00 02 01 AB CD;

After receiving command, model will output “ 02 00 00 01 00 33 31” and start scan.

#### Time settlement for single read

Read and Scan time before output. From 0.1s to 25.5s, step size 0.1s. 0 : infinite time interval;  
Default: 5s

1000ms

3000ms

Default 5000ms

infinite time interval

200ms

300ms

400ms

### 3.5 POS Mode

Users can quickly configure the module to work in POS mode by scanning the following code. Including the following main features:

- Read mode is command trigger mode
- The communication interface is serial port
- Turn off startup tone
- Turn off ending character

POS Mode

## 4 Read area

### 4.1 Full Width Area

When the read area is a full-width area, the module will scan the barcode around with the center as the priority, and the barcode can be located at any position of the screen.

\*Full Width Area

### 4.2 Central Area only

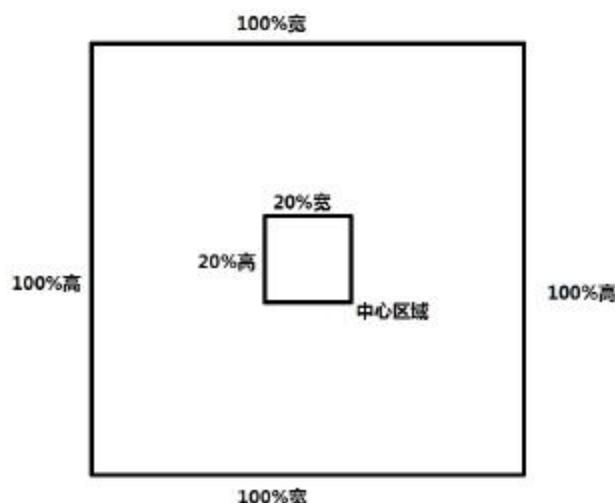

When the reading area is the central area, the central position of the barcode must be in the central area set. Bar codes are not within the scope of the region are not identified and output.

Central Area only

Set the size of the central area:

The central area is an area with the center of the whole image as the central point. The size of this area is set in proportion to the width or height of the whole image, and the value range is 1-100. If set to 20, it is located in an area 20% of the width \* 20% of the height of the center.

### Modify the central area size

The common central area size can be set by scanning the following code:

central area size-20%

central area size-40%

central area size-60%

When the common central area size does not meet the needs, users can also scan the "modify the central area size" setting code to customize the configuration.

modify the central area size

Example: change the center area size to 50%

1. Check the character table to get the hexadecimal value of "50" characters: "32"
2. Confirm whether the setting code is on or not. If it is off, please scan the "open setting code" setting code (see section 1.6).
3. Scan the setting code of "modify the size of central area"
4. Scan data setting codes "3" and "2" successively (see appendix F)
5. Scan "save" setting code (see appendix G)

## 5 Lighting and Collimate

### 5.1 Lighting

Head lamp is used to additional lighting when read.

Normal(default): Head lamp will be on when read, others off.

Normally on: always on after boot.

OFF: head lamp is always off

\*Normal

Normally on

Off

### 5.2 Collimation

There will be a pointing light beam which can help user to find best distance.

Normal(default): pointing light beam shows when read

Normally on: pointing light beam shows after power on until power off

No Collimation: no pointing light beam

Normal(default)

Normally on

No Collimation

## 6 Prompts

### 6.1 Sound Prompts

#### 6.1.1 Passive Buzzer

Read "buzzer drive frequency", the buzzer can be set to active/passive buzzer, the drive frequency of the passive buzzer can also be set.

Buzzer drive frequency-passive high frequency

\*Buzzer drive frequency-passive medium frequency

Buzzer drive frequency-passive low frequency

#### 6.1.2 Active Buzzer

Buzzer drive frequency - active drive

In the active buzzer mode, scan "Buzzer working level - high" can be set to low level when free, high level when busy; scan "Buzzer working level - low" can be set to high level when free, low level when busy.

\*Buzzer working level - high

Buzzer working level - low

## 6.2 All Prompts Tone

Silence: Close all prompt tones

Silence on

\*Silence off

## 6.3 Open Start-up Tone

Scan “Open Start-up tone” can open start-up tone. Scan “Close Start-up tone” can close start-up tone.

\*Open Start-up tone

Close Start-up tone

## 6.4 Read Code Prompts Tone

Read code prompt tone includes set the prompt tone and the read code successfully prompt tone:

\*Allow

Forbid

#### 6.4.1 Successfully Prompts Tone Setting

In the state of "Allow Prompt Tone", you can scan the configuration code to enable or disable the setting success tone and reading success tone.

\*Open the setting success prompt tone

Close the setting success prompt tone

#### 6.4.2 Read Successfully Prompts Tone

\*Open the reading success prompt tone

Close the reading success prompt tone

#### 6.4.3 Duration Time Setting

Duration time setting. Default: 60ms

30ms

\*60ms

90ms

120ms

## 6.5 Data Code Format

Read following to enable the reading module to read the Chinese barcode of various encoding format.

Input Data code format GBK

Input Data code format UTF8

\*Input Data code format AUTO

\*Output Data code format GBK

Output Data code format UTF8

Output Data code format RAW OUTPUT

## 6.6 OUT1 Pin output

To make it easier for developers to develop applications in special environments, add OUT1 pin control

By default, the OUT1 pin is low level after power-on. It is controlled by serial port command, and the state is not saved after power-off.

Input: 7E 00 08 01 00 E7 00 AB CD    Output Low Level

Output: 02 00 00 01 00 33 31

Input: 7E 00 08 01 00 E7 01 AB CD    Output High Level

Output: 02 00 00 01 00 33 31

## 6.7 Keyboard Settlement

Scan following code to change keyboard.

Default Keyboard- US

Czech

France

Germany/Austria

Hungary

Italy

Japan

Spain

Turkey-F

Turkey-Q

Portugal

Brazil (Portuguese)

UK

Netherlands

Finland

Denmark

Poland

Sweden

Belgium (French)

Norway

Slovakia

Romania

Israel

Switzerland

Latin America (Spanish)

Russia

Canada (French)

Greece

Thailand

## 6.8 Virtual keyboard Allow

In order to be able to use in more areas, we also provide the virtual keyboard function, so that the virtual keyboard can be output in any keyboard mode, but it will relatively lose some output efficiency. In addition, when using a virtual keyboard, you must ensure that the numeric keys on the keypad are valid. Note that the virtual keyboard must be available at version 1.21 or above.

\*Standard keyboard

Virtual keyboard

In order to adapt to different application scenarios, the virtual keyboard has two different output modes for control characters smaller than 0x20, and the user can switch by scanning the following code.

**Ctrl Mode**

**\*Alt Mode**

## 7 Data Edition

Sometimes we need to edit the data before output to make data separation and processing more easily.

Data edition include:

- Add Prefix
- Output Identification Code AIM ID
- Output CodeID
- Add Suffix
- Cut data
- Add End words "Tail"

Output sequence after data edition:

【Prefix】 【AIM ID】 【CodeID】 【Data】 【Suffix】 【Tail】

### 7.1 Prefix

#### Add prefix

Prefix is on the head of encoding Information , and can be self-defined.

Scan the code to add prefix.

Allow to add prefix

Default no prefix

#### Change prefix

Scan “change prefix” and “setup code” code to change prefix.

Use 2 base 16 to express each character.

Max 15 characters.

ASCII on appendix E.

**E.G. Change prefix to “DATA”**

1. “DTAT” in base 16: “44”, “41”, “54”, “41”
2. Confirm open the “ setup code”, if not, find on 1.6
3. Scan “change prefix” code
4. Successively scan “Code ID”: “4”, “4”, “4”, “1”, “5”, “4”, “4”, “1”
5. Scan “save” code

## 7.2 AIM ID

AIM is Automatic Identification Manufacturers. AIM ID defines identification codes for various standard bar codes (users cannot customize AIM ID). For specific definitions, see Appendix C: AIM ID List. After decoding, the scanner can add this identification code to the bar code data, the format is "] "+letter" C "+ digit" 0 ". For example, the AIM ID of Code 128 is "]C0 ".

**Add AIM ID**

Users can identify different bar code types by AIM ID.

Users are not allowed to change the AIM ID which corresponding to each bar Code type. The Code ID is identified by three characters.

## 7.3 CODE ID

**Add CODE ID**

Users can identify different types of bar code by CODE ID. CODE ID use one character to identify and can be self- defined.

Allow add CODE ID

Default close CODE ID

**Default of CODE ID**

Scan “Default of CODE ID” to back default ID, default ID on appendix D

\*all bar code back to default Code ID 0

all bar code back to default Code ID 1

all bar code back to default Code ID 2

**Change CODE ID**

Users can change CODE ID of any bar code by scan the setup code (as follow) and data edition code.

Base 16 is used to express each CODE ID.

ASCII on appendix E.

**E.G.: change CODE ID of CODE 128 to “A”**

1. Find “A”=“41” in base 16
2. Confirm opening the “setup code”, if not, find on 1.6
3. Scan “change CODE 128”
4. Successively scan “Code ID”: “4”, “1”
5. Scan “save” code

## Change CODE ID LIST

Change CODE ID of EAN13

Change CODE ID of EAN8

Change CODE ID of UPCA

Change CODE ID of UPCE0

Change CODE ID of UPCE1

Change CODE ID of CODE 128

Change CODE ID of CODE 39

Change CODE ID of CODE 93

Change CODE ID of CODE BAR

Change CODE ID of Interleaved 2 of 5

Change CODE ID of Industrial 25

Change CODE ID of Matrix 2 of 5

Change CODE ID of CODE 11

Change CODE ID of MSI

Change CODE ID of RSS

Change CODE ID of limited RSS

Change CODE ID of expended RSS

Change CODE ID of QR CODE

Change CODE ID of Data Matrix

Change CODE ID of limited PDF417

Change CODE ID of MICROQR

Change CODE ID of AZTEC

Change CODE ID of MICROPDF417

Change CODE ID of ISBN

Change CODE ID of GS1STACK

Change CODE ID of ISSN

## 7.4 Cut out Data

Open to output part of data.

[Data] is composed of [Start] + [Center] + [End]

Character length of “start” and “end” can be changed

\*Output whole data

Output Start part

Output End Part

Output Center part

### Change length of [Start]-M

Scan “ Change M” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix E.

Change M

### Change length of [End]-N

Scan “ Change N” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix E.

**Change N****Output Start part****E.G. Output “1234567890123” of whole decode information “ 1234567890123ABC”**

1. “13” =“0D” in base 16
2. Confirm opening the “setup code”, if not, find on 1.6
3. Scan” change length M”
4. Successively scan “Code ID”: “0”, “D”
5. Scan “save” code
6. Scan” Output Start part”

**Output End Part****E.G. Output “ABC” of whole decode information “ 1234567890123ABC”**

1. “3” = “03” in base 16
2. Confirm opening the “setup code” , if not, find on 1.6
3. Scan "change length N"
4. Successively scan “Code ID”:"0", “3”
5. Scan “save” code
6. Scan” Output Start part”

**Output Center part****E.G.: Output “0123” of whole decode information “ 1234567890123ABC”**

1. “ 10” =”0A”; “3”=“03” in base16
2. Confirm opening the “setup code” , if not, find on 1.6
3. Scan “change length N”
4. Successively scan “Code ID”:"0", “3”
5. Scan “save” code
6. Scan ” change length M”
7. Successively scan :Code ID”: “0”, “A”
8. Scan “save” code
9. Scan “Output Center part”

## 7.5 Suffix

### Add Suffix

Suffix on the end of encoding Information, and can be self-defined.

Allow add suffix

Default no suffix

### Change suffix

Scan “ change suffix” and “setup code” code to change prefix.

Use base 16 to express each character.

Max 15 characters. ASCII on appendix E.

Change Suffix

### E.G.: Change suffix to “DATA”

1. “DTAT” in base 16: “44”, “41”, “54”, “41”
2. Confirm opening the “setup code”, if not, find on 1.6
3. Scan “change suffix” code
4. Successively scan “Code ID”: “4”, “4”, “4”, “1”, “5”, “4”, “4”, “1”
5. Scan “save” code

## 7.6 Tail

Open this function to help system quickly distinguish current decoding results.

Scan “Change tail” to open this function, if read success, there will be tail on the end of decode data.

Close tail

\*Change tail to “CR”

Change tail to “TAB”

Change tail to “CRLF”

Change tail to two “CRLF”

## 7.7 RF Information

RF(Read Fail): Users can self- define output information when read fail.

Output RF information

Default not output

### Change RF information

Scan “change RF information” and “data edition code” to change RF information.

Base 16 is used to express, max at 15 character. ASCII on appendix E.

Change RF information

### E.G.: change RF to “FAIL”

1. Find “FAIL” in base-16: “46”, “41”, “49”, “4C”
2. Confirm opening the “setup code”, if not, find on 1.6
3. Scan “ change RF information”
4. Successively scan “4” 、 “6” 、 “4” 、 “1” 、 “4” 、 “9” 、 “4” 、 “C”

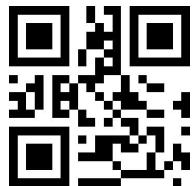

- 
5. Scan “save” code

## 7.8 Output Protocol

The output format of the decoded result can be modified in serial/virtual serial mode by scanning the following Settings code.

The format output with protocol is as follows: <03>< length >< decoded data >.

Note: The protocol mode must use UTF-8 data output format. In other output formats, only output the pure data even if the output with the protocol is selected.

\*Pure data

With the agreement

## 8 Bar code type enables/disable configuration

### 8.1 All types of bar code can be decoded

After scan “Forbid read all bar code”, module will only support to scan setup code.

Support all

Forbid read all bar code

\*Open default support types

### 8.2 Strengthen the Reading Ability

The bar code reading ability is enhanced through configuration, which will improve the reading Angle of all bar codes, improve the equipment's support for angles above 45°, and improve the contrast and gradient code support. Disabling Angle hardening will increase decoding speed.

\*Forbid to enhanced

Enhanced

### 8.3 EAN13

#### 8.3.1 EAN13

\*Allow reading EAN13

Forbid reading EAN13

### 8.3.2 EAN13 Transfer Check Character

EAN-13 bar code data is fixed at 13 bytes, and the last byte is the check character. Enable or disable the function of EAN-13 to transmit check characters by scanning the following setting codes.

\*Allow

Forbid

### 8.3.3 EAN13 Extra-code

\* 2 bits extra-code Forbidden

2 bits extra-code Allow

\*5 bits extra-code Forbidden

5 bits extra-code Allow

### 8.3.4 EAN13 Output Mode

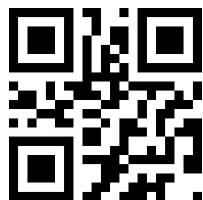

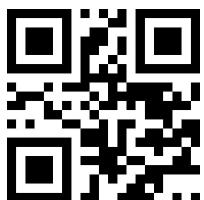

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

\*No need to read Extra-code, output directly

Have to read extra-code then have output

\*EAN-13 without Extra-code   Only read codes with Extra-code   Read with or without Extra-code

## 8.4 ISSN

### 8.4.1 ISSN

Allow reading ISSN

\*Forbid reading ISSN

### 8.4.2 ISSN Extra-code

\* 2 bits extra-code Forbidden

2 bits extra-code Allow

\* 5 bits extra-code Forbidden

5 bits extra-code Allow

### 8.4.3 ISSN Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

\*No need to read Extra-code, output directly

Have to read extra-code then have output

## 8.5 ISBN

### 8.5.1 ISBN

Allow reading ISBN

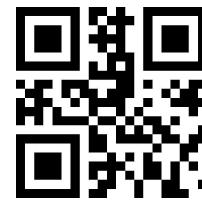

\*Forbid reading ISBN

### 8.5.2 ISBN Extra-code

\*2 bits extra-code Forbidden

2 bits extra-code Allow

\*5 bits extra-code Forbidden

5 bits extra-code Allow

### 8.5.3 ISBN Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

\*No need to read Extra-code, output directly

Have to read extra-code then have output

## 8.6 EAN8

### 8.6.1 EAN8

\*Allow reading EAN8

Forbid reading EAN8

### 8.6.2 EAN8 Transfer Check Character

EAN8 bar code data is fixed at 8 bytes, and the last byte is the check character. Enable or disable the function of EAN8 to transmit check characters by scanning the following setting codes.

\*Allow

Forbid

### 8.6.3 EAN8 Extra-code

\* 2 bits extra-code Forbidden

2 bits extra-code Allow

\*5 bits extra-code Forbidden

5 bits extra-code Allow

#### 8.6.4 EAN8 Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

\*No need to read Extra-code, output directly

Have to read extra-code then have output

#### 8.6.5 EAN-8 to EAN-13

Allow

## 8.9 Code128

### 8.9.1 Code128

\*Allow reading Code128

Forbid reading Code128

### 8.9.2 Code128 Min Length of Reading

Scan following code to change min length of code 128

Code128 min length at 0

\*Code128 min length at 4

## 8.10 Code39

### 8.10.1 Code39

\*Allow reading Code39

Forbid reading Code39

### 8.10.2 Code39 Min Length of Reading

Scan following code to change min length of code39

Code39 min length at 0

\*Code39 min length at 4

### 8.10.3 Code39 Check Setting(Modulo 43)

Code 39 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transferred together with the last 1 bit. If the verification fails, the barcode content will not be sent.

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

When set to "Allow Check,no transfer check character",if the data length is less than the minimum read length after deducting the 1 byte check character, the read will fail.

For example, the minimum read length of Code 39 is 4 bytes, and no transfer check characters, the attempt to read Code 39 with a total length of 4 bytes will fail.

#### 8.10.4 Code39 Start/End Character Settings

Scan following code to change start character and end character output of code 39

\*Start character No Output

Start character Output

\*End character No Output

End character Output

#### 8.10.5 Code39 Full ASCII

\*Forbid FullAsc Mode

Allow FullAsc Mode

### 8.10.6 Code39 Pharmaceutical (PARAF)

Code 32 Pharmaceutical is a form of Code 39 used in Italian pharmacies.

The bar code is also known as PARAF. The output format of Code 32 is: \* + A + 8-bit digits + 1-bit check + \*.

Code 32 Pharmaceutical can only be read if Code39 is enabled and no checksum.

\*Forbid Code 32

Allow Code 32

## 8.11 Code93

### 8.11.1 Code93

\*Allow reading Code93

Forbid reading Code93

### 8.11.2 Code93 Min Length of Reading

Scan following code to change min length of code93

Code93 min length at 0

\*Code93 min length at 4

### 8.11.3 Code93 Check Setting

Code 93 does not enforce the inclusion of a check character; if there is a check character, it must be

the last 2 bytes of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 2 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last 2 digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 2 bits of the barcode data. If the verification passes, the check character will be transfer the last 2 bits together. If the verification fails, the barcode content will not be sent.

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 2 bytes check character, the read will be fails.

For example, the minimum read length of Code 93 is 4 bytes, and no transfer check characters, the attempt to read Code 93 with a total length of 4 bytes will fail.

## 8.12 CodeBar

### 8.12.1 CodeBar

\*Allow reading CodeBar

Forbid reading CodeBar

### 8.12.2 CodeBar Min Length of Reading

Scan following code to change min length of CodeBar

CodeBar min length at 0

\*CodeBar min length at 4

### 8.12.3 CodeBar Check Setting(Mod-16)

Codebar does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Codebar is 4 bytes, and no transfer check characters, the attempt to read Codebar with a total length of 4 bytes will fail.

#### 8.12.4 CodeBar Start/End Character Settings

There is a byte before and after the data as the start and end character, the start and end characters are one of the four characters "A", "B", "C", and "D",

You can set whether the start and end characters are transmitted together with the bar code data after read successful.

Scan following code to change start character and end character output of codebar.

Send CodeBar Start Character

\*Don't send CodeBar Start Character

#### 8.13 Interleaved 2 of 5

##### 8.13.1 Interleaved 2 of 5

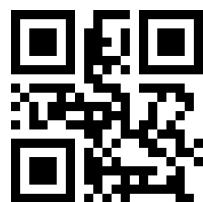

Allow

\*Forbid

##### 8.13.2 Interleaved 2 of 5 Min Length of Reading

Interleaved 2 of 5 min length at 0

\*Interleaved 2 of 5 min length at 4

### 8.13.3 Interleaved 2 of 5 Check Setting(Mod-10)

Interleaved 2 of 5 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

Interleaved 2 of 5 code bits must be even and the check character is included in the code. If the code is odd, 0 will be added before the first bit. Check characters are automatically generated during code generation.

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Interleaved 2 of 5 is 4 bytes, and no transfer check characters, the attempt to read Interleaved 2 of 5 with a total length of 4 bytes will fail.

## 8.14 ITF-14

ITF-14 is a specific format of Interleaved 2 of 5 bar code. The total length of its data is 14 bytes. The last byte is the check character.

### 8.14.1 ITF-14

Allow

\*Forbid

## 8.15 ITF-6

ITF-6 is similar to ITF-14. The fixed total length is 6 bytes.

### 8.15.1 ITF-6

\*Forbid Check

**Allow Check,no transfer check character****Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Matrix 2 of 5 is 4 bytes, and no transfer check characters, the attempt to read Matrix 2 of 5 with a total length of 4 bytes will fail.

## 8.18 Code 11

### 8.18.1 Code 11

**Allow****\*Forbid**

### 8.18.2 Code 11 Min Length of Reading

**Code 11 min length at 0****\*Code 11 min length at 4**

### 8.18.3 Code 11 Check Setting

Code 11 does not enforce the inclusion of a check character; if there have check character, it must be the last byte of the data or last 2 byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

## 8.19 MSI-Plessey

### 8.19.1 MSI-Plessey

Allow

\*Forbid

### 8.19.2 MSI-Plessey Min Length of Reading

MSI-Plessey min length at 0

\*MSI-Plessey min length at 4

### 8.19.3 MSI-Plessey Check Setting

MSI-Plessey does not enforce the inclusion of a check character; if there have check character, it must be the last byte of the data or last 2 byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

\*Forbid Check

MSI 1 bit check

MSI 2 bit check

#### 8.19.4 MSI-Plessey Transfer check character

\*MSI Transfer Check Character

MSI NO Transfer Check Character

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 2 bytes check character, the read will be fails.

### 8.24.2 DM Double Code Read

Data Matrix double code: two Data Matrix bar codes arranged up and down or left and right. The direction of the double code should be consistent, the difference should be as small as possible, and the distance should be as close as possible. The two code setting is divided into the following three settings.

Only read single Data Matrix: The device only read one Data Matrix bar code at any time

Only read double Data Matrix: At any time, the device must detect the Data Matrix double code and send the decoding information only after both codes are decoded successfully. The sending sequence is from top to bottom or left to right.

Can read single and double DM codes: Readable single and double Data Matrix codes: check whether the Data Matrix double codes exist first when reading codes. If the Data Matrix double codes exist and are decoded successfully, the Data Matrix double codes will be sent; otherwise, the Data Matrix double codes will be processed as single codes.

\*Only read single Data Matrix

Can read single and double DM codes

## 10 Serial Port Instruction

Users can settle the module by sending instruction from mainframe.

Please make sure communicate parameter complete matching between module and mainframe.

Module default serial communicate parameter: **Baud rate 9600bps; No check; 8 bit data; 1 bit stop bit; No flow control.**

### 10.1 CRC Algorithm

CRC: CRC\_CCITT check value (2 bytes).

Suitable for Types、Lens、Address、Datas;

Characteristic polynomial : X<sup>16</sup>+X<sup>12</sup>+X<sup>5</sup>+1, multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

Reference code of C:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //上一位 CRC 乘 2 后, 若首位是 1, 则除以 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //如果本位是 1, 那么 CRC = 上一位的 CRC + 本位/CRC_CCITT
                crc ^= 0x1021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
} // unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
```

PS: when no need for checking CRC, CRC bite can be filled in 0xAB 0xCD

## 10.2 Read Zone Bit

Max 256 bytes/time for zone bit reading.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x07 (1 byte)

Lens: 0x01 (1 byte)

Address : 0x0000~0x00FF (2 bytes) , address to start reading zone bit

Datas: 0x00~0xFF (1 byte) , Numbers of zone bit for Sequential read, 0x00= 256bytes

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Datas;

Characteristic polynomial : X<sup>16</sup>+X<sup>12</sup>+X<sup>5</sup>+1, multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1, so divide 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //If the standard is 1, so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x1021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
}// unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Read successfully and return data

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: numbers of upload bytes (1 byte) 0x00 means 256

Data: 0x00~0xFF means read data.

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Data;

Characteristic polynomial : X<sup>16</sup>+X<sup>12</sup>+X<sup>5</sup>+1, multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

(The reference code is the same as above)

2) CRC failed

No response command

3) Unknown command response

No response command

#### E.G.:

Read address 0x000A of Zone bit

1) Read successfully and return data is 0x3E.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0xEE 0x8A

Output: 0x02 0x00 0x00 0x01 0x3E 0xE4 0xAC

2) CRC wrong

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0x11 0x22

Output : None

3) When length of command to short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01

Output: None

## 10.3 Write Zone Bit

Max 256 bytes/time for zone bit reading.

**The modified content of the zone bit will be lost after power failure. If the modified content is needed after power loss, You need to save the zone bit to internal Flash(10.4).**

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x08 (1 byte)

Lens: 0x00~0xFF (1 byte) , means numbers of bytes of this datas, times of continuous writing.

Address: 0x0000~0xFFFF (2 bytes) , start location of write

Datas: 0x00~0xFF (1~256 bytes) , dates wrote in zone bit. When configuring multiple zone bit,must follow the order of address from low to high to fill the data domains.

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Datas;

Characteristic polynomial : X<sup>16</sup>+X<sup>12</sup>+X<sup>5</sup>+1, multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```
unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1, so divide 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //If the standard is 1, so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x1021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
} // unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Read successfully

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: 0x01 (1 byte)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0x33 0x31) (2 bytes)

2) CRC failed

No response command

3) Unknown command response

No response command

**E.G.:**

Write 0x3E in 0x000A of zone bit

1) Successfully set

Input : 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x4C 0xCF

Output: 0x02 0x00 0x00 0x01 0x00 0x33 0x31

2) CRC wrong

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x11 0x22

Output: None

3) When length of command to short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E

Output: None

## 10.4 Save Zone Bit To Internal Flash Instruction

To save the device of the zone bit list to internal Flash,you need to send a save command.

**Note:** the device cannot save a single zone bit configuration separately, and must keep the entire list at the same time.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x09 (1 byte)

Lens: 0x01 (1 byte)

Address: 0x0000 (2 bytes)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0xDE 0xC8) (2 bytes)

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: 0x01 (1 byte)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0x33 0x31) (2 bytes)

2) CRC failed

No response command

3) Unknown command response

No response command

## 10.5 Zone Bit Reset To Defaults

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x08 (1 byte)

Lens: 0x01 (1 byte)

Address: 0x00D9 (2 bytes)

Datas: 0x50 (1 byte)

CRC: CRC\_CCITT check value (81 D3) (2 bytes)

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: 0x01 (1 byte)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0x33 0x31) (2 bytes)

2) CRC failed

No response command

3) Unknown command response

No response command

## 10.6 List of zone bit

Zone Bit	0x0000		
Data Bit	Function		
Bit 7	1: Open LED when successfully read	0: Close	
Bit 6	1: Mute off	0: Mute on	
Bit 5-4	00: No light	01: Standard	10/11: Always on
Bit 3-2	00: No light	01: Standard	10/11: Always on
Bit 1-0	00: Manual Mode	01: Command Triggered Mode	10: Continuous mode 11: Induction Mode
Zone Bit	0x0002		
Data Bit	Function		
Bit 7-1	Keep		
Bit 0	Command mode triggers flags, Automatically reset after scanning 1: trigger    0: no trigger		
Zone Bit	0x0003		
Data Bit	Function		
Bit 7-2	HID query cycle. Cycle = (Reg0x0003[7:2]+1) ms		
Bit 1	1: Close Settlement Code	0: Open	
Bit0	1: Output content of settlement code	0: Not output	
Zone Bit	0x0004		
Data Bit	Function		
Bit 7-0	The time of Image stabilization 0x00-0xFF: 0.0-25.5s		
Zone Bit	0x0005		
Data Bit	Function		
Bit 7-0	Read interval 0x00: No interval    0x01-0xFF: 0.0-25.5s		
Zone Bit	0x0006		
Data Bit	Function		
Bit 7-0	Time for single read 0x01-0xFF: 0.0-25.5s		
Zone Bit	0x0009		
Data Bit	Function		
Bit7-2	HID the interval before release    Interval = (Reg0x0009[7:2]) ms		
Bit 1-0	Image rollovers 00: Forbid    01: Allow    10/11: Keep		
Zone Bit	0x000A		
Data Bit	Function		
Bit 7-0	Frequency for successfully read sound 0x00: Active buzzer mode    0x01-0xFF: passive buzzer mode drive frequency =Value*20		

Zone Bit	0x000B
Data Bit	Function
Bit 7-0	Time duration for successfully read sound 0x00-0xFF; 0-255ms
Zone Bit	0x000C
Data Bit	Function
Bit 7-2	HID the interval after release      Interval = (Reg0x000C[7:2]) ms
Bit1	CapsLock Switch    0: On 1: Off
Bit0	Piezo Buzzer 0: high level when free, low level when busy 1: low level when free, high level when busy
Zone Bit	0x000D
Data Bit	Function
Bit 7	0
Bit 6	Virtual keyboard enable flags      0: Forbid      1: Allow
Bit5-4	Input data encoding format 00: GBK      01: Keep      10: AUTO      11: UTF8
Bit 3-2	Output data encoding format 00: GBK      01: UNICODE      10: Keep      11: UTF8
Bit1-0	00: serial port output 01: USB PC Keyboard 10: Keep 11: USB virtual serial port
Zone Bit	0x000E
Data Bit	Function
Bit3	Keep
Bit2	1: Decode successfully sound on      0: Decode successfully sound off
Bit1	1: Turn off start-up tone      0: Turn on start-up tone
Bit0	1: Allow serial port mode HID protocol      0: Forbid
Zone Bit	0x000F
Data Bit	Function
Bit7-0	Sensitivity adjustment parameter 1 0x00-0xFF: higher value, lower sensitivity, default value 0x32
Zone Bit	0x0010
Data Bit	Function
Bit7-0	Sensitivity adjustment parameter 2 0x00-0xFF: higher value, lower sensitivity, default value 0x0A
Zone Bit	0x0013
Data Bit	Function
Bit 7	Same barcode reading delay setting 0: Turn off      1: Turn on
Bit 6-0	Same barcode reading delay time (Unit: 100ms) 0x00: Infinite length      0x01-0x7F: 0.1-12.7s;
Zone Bit	0x0014

## 11 Appendix A: Common serial port instruction

Parameter	Default Setting		Note
<b>Communication interface</b>			
TTL-232	Baud rate	9600	
	Verification	No	
	Data Bit	8 bit	
	Stop Bit	1 bit	
	CTSRTS	No	
<b>Mode Parameter</b>			
<b>Default Read Mode</b>		<b>Continuous Mode</b>	
Serial mode	Read code time for once	5s	Parameter:0.1-25.5s; step-size: 0.1s; 0 means no time limited

## 12 Appendix B: Common serial port instruction

Function	Instruction
Baud rate to 9600	7E 00 08 02 00 2A 39 01 A7 EA
Save settlements to Internal Flash	7E 00 09 01 00 00 00 DE C8
Find baud rate	7E 00 07 01 00 2A 02 D8 0F
LED on + Mute off+Normal lighting +Normal brightness+Continuous mode	7E 00 08 01 00 00 D6 AB CD
Trigger mode	7E 00 08 01 00 02 01 AB CD
Full area + allow read all bar codes	7E 00 08 01 00 2C 02 AB CD
Allow read Code39	7E 00 08 01 00 36 01 AB CD
Code39 Min length	7E 00 08 01 00 37 00 AB CD
Code39 Max length	7E 00 08 01 00 38 FF AB CD
Allow to add suffix	7E 00 08 01 00 60 03 AB CD
Modify the suffix command 7E 00 08 (N+1) 01 10 (N) (N byte suffixes) AB CD Example (Add a four-byte suffix "DATA")	7E 00 08 05 01 10 04 44 41 54 41 AB CD
Cut out data:Output Start part	7E 00 08 01 00 B0 01 AB CD
Cut out M bytes from start	7E 00 08 01 00 B1 FF AB CD
Output End part	7E 00 08 01 00 B0 02 AB CD
Cut out N bytes from end	7E 00 08 01 00 B2 FF AB CD
Output center part	7E 00 08 01 00 B0 03 AB CD
Cut out M bytes from start (Eg: three characters)	7E 00 08 01 00 B1 03 AB CD
Cut out N bytes from end (Eg: two characters)	7E 00 08 01 00 B2 02 AB CD
OUT1 Output low level	7E 00 08 01 00 E7 00 AB CD
OUT1 Output high level	7E 00 08 01 00 E7 01 AB CD
Allow AIM ID	7E 00 08 01 00 D0 80 AB CD
Forbid AIM ID	7E 00 08 01 00 D0 00 AB CD

Module will return following info after mainframe send serial port instruction - find baud rate

Return information	Baud rate
02 00 00 02 C4 09 SS SS	1200
02 00 00 02 71 02 SS SS	4800
02 00 00 02 39 01 SS SS	9600
02 00 00 02 D0 00 SS SS	14400
02 00 00 02 9C 00 SS SS	19200
02 00 00 02 4E 00 SS SS	38400
02 00 00 02 34 00 SS SS	57600

PS: SS SS= check value

## 13 Appendix C: AIM ID

Code Type	AIM ID	Instruction
Code 128	]C0	Code 128
EAN-8	]E4	EAN-8
EAN-13	]E0	EAN-13
ISSN	]X5	
ISBN	]X4	
UPC-E	]E0	UPC-E
UPC-A	]E0	UPC-A
Interleaved 2 of 5	]I0	No parity
ITF-6	]I1	Output check character
ITF-14	]I1	Output check character
Matrix 2 of 5	]X1	No parity
Industrial 25	]S0	No specific designation now
Standard 25	]R0	No parity
China Post 25	]X0	
Code 39	]A1	MOD 43 check, Output check character
Codabar	]F0	Standard data packet
Code 93	]G0	No specific designation now
Code11	]H1	MOD11/MOD11 double check, Output check character
MSI Plessey	]M1	MOD10 check, but no output check character
GS1 Composite	]em	(0~3), possible AIM ID qualifying parameter (m)
GS1 Databar (RSS)	]e0	RSS-14, RSS-Limited, RSS-Expanded, RSS-Stacked
PDF417	]L0	Conform to 1994 PDF417
Data Matrix	]d1	DM code ECC 200
QR Code	]Q1	QR code mode 2( 2005 symbol), The ECI protocol is not used
Micro PDF417	]L0	
Micro QR	]Q1	
Aztec Code	]zm	(0-9, A-C), Possible AIM ID qualifying parameter (m)

## 17 Appendix G: Save or Cancel

After reading the data code, you need to scan the "save" setting code to save the data which you read. If there is an error when reading the data code, you can cancel the error reading.

For example, read a set code, and read data "A", "B", "C" and "D" in turn.

If you read "cancel the last read bit", the last read digit "D" will be cancelled.

If you read "cancel the previous read a string of data" will cancel the read data "ABCD",

If you read "cancel modification Settings", you will cancel the data "ABCD" and exit the modification Settings.

Save

Cancel the last read bit

Cancel the previous read a string of data

Cancel modification settings
